

# Dante Config Editor V3.07

Quick start - offline editing of Dante XML files

Third-party tool, not an official Audinate product. V3.07 is the stable project release. Work on a copy and always validate the final XML by importing it into the appropriate official Dante tool before real use.

## Recommended workflow

- 1** Open XML  
Choose a Dante export. The application works offline and does not access the network.
- 2** Review alerts  
Show affected devices and verify every reported item.
- 3** Edit  
Use Device details, Visual patch, or global actions. Lock devices that must be excluded.
- 4** Review  
Use Modified only and Before / after. Unknown technical changes are blocked.
- 5** Save as  
Choose a new name. The destination is replaced atomically and backed up when it already exists.
- 6** Test the import  
Import the result into Dante Controller on a working copy before any field operation.

## Useful features

|                                                                                                                                                                                |                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Visual patch</b><br>Select several Tx channels, then assign them to following Rx channels by button or drag and drop. The matrix stays limited to the two selected devices. | <b>Recovery</b><br>A copy is written in the background after a short delay. Save as makes the new destination the session reference. |
| <b>Sub-project</b><br>Add XML to project imports unique devices and only asks about conflicting names.                                                                         | <b>IPv4</b><br>Only the primary interface is targeted. DNS and the secondary interface are not rewritten implicitly.                 |

Remember: no real-time control, no Audinate API, and no guarantee for every XML format. Import validation in official tools remains mandatory.
