

Dante Config Editor V3.2

Quick start - offline editing of Dante XML files

Third-party tool, not an official Audinate product. V3.2 is the project's current official version and may still contain bugs. Work on a copy and always validate the final XML by importing it into the appropriate official Dante tool before real use.

Recommended workflow

- 1** Open XML
Choose a Dante export. The application works offline and does not access the network.
- 2** Review alerts
Show affected devices and verify every reported item.
- 3** Edit
Use Device details, Easy patch on Windows, the visual patch workshop on Mac, or global actions. Lock devices that must be excluded.
- 4** Review
Use Modified only and Before / after. Unknown technical changes are blocked.
- 5** Save as
Choose a new name. The destination is replaced atomically and backed up when it already exists.
- 6** Test the import
Import the result into Dante Controller on a working copy before any field operation.

Useful features

Visual patch On Windows, every preview joins a cumulative batch and the compact matrix supports drag ranges. On Mac, use the Avalonia visual workshop.	Recovery A copy is written in the background after a short delay. Save as makes the new destination the session reference.
Import / Export JSON/CSV, DMT XLSX, A&H; CSV and Yamaha ZIP/CSV labels, reports, and the synoptic are grouped in one workspace.	Synoptic Group devices by location and export a colored SVG without changing Dante XML.

Exercise: Atomic Bomb has its own tab after Safety and log. It asks for three confirmations and then scrambles the XML copy in memory. Technical identifiers remain protected; use Save as to create the trainee file.

Remember: no real-time control, no Audinate API, and no guarantee for every XML format. Import validation in official tools remains mandatory.
